

MULTI-PHOTON POLYMERIZATION

Multi-photon polymerization (MPP) is a unique method allowing the fabrication of 3D microstructures with a spatial resolution of the order of 100 nm. MPP technology is based on non-linear absorption at the focal spot of a tightly focused femtosecond laser beam, which induces well confined photopolymerization reactions. <290 fs pulses at >100 kHz repetition rates are advantageous for material modification via avalanche ionization – enabling fabrication of materials ranging from hybrid composites to pure proteins.

APPLICATION IN MICRO-OPTICS

Most of the photopolymers used in MPP technology are transparent in the visible range and could be directly applied in various micro-optical applications. Various mechanical as well as optical properties can be tuned [1, 2].

Examples: prisms, aspherical lenses, lenses on the tip of an optical fiber, multi-lens arrays, vortex beam generators, diffractive optical elements, etc.

APPLICATION IN PHOTONICS

Highly repeatable and stable technological process enables the fabrication of various photonic crystal devices for controlling spatial and temporal properties of light at micrometer distances [3-6].

Examples: photonic crystal spatial filters, supercollimators, structural colours, etc.

APPLICATION IN BIOTECHNOLOGY AND REGENERATIVE MEDICINE

MPP technique can be realized in biocompatible and even biodegradable materials, thus it is a perfect platform for regenerative medicine research and applications [7].

Examples: 3D polymeric scaffolds for cell growth and tissue engineering, drug delivery devices, micro-fluidic devices, cytotoxic elements.

APPLICATION IN MICROMECHANICS

MPP technology gives the user ability to create multiscale and multimaterial 3D objects out of substances with various physical, chemical, and biological properties.

Examples: cantilevers, valves, micro-pore filters with controllable pore sizes, mechanical switches. [8]

Examples of multicomponent structures [9]

LASER ABLATION

Nanocrystals and nanotubes or any other 3D microstructures can be made, also tool-free cutting and drilling. Applications in micromechanics, medicine.

Samples provided by Femtika
www.femtika.lt

LASER ASSISTED SELECTIVE ETCHING

Can be applied in microoptics, micromechanics, medical engineering, etc.
